Hear the signal. Never the source.

A private signal market on Midnight.

Insiders stake a private pick.
Buyers open the combined signal.

Working Preprod prototype

Poor context can cost both sides time and capital.

	Missing context	Decision	Potential cost
Ecosystem	Team execution is hard to assess	Fund a team with unresolved blind spots	Budget at risk Better teams missed
Builder	Support and audit access are hard to verify	Commit build time to a mismatched program	Launch delays Runway pressure

The cost can grow after a grant is allocated or a team commits its build time.

Potential consequences · hypotheses to validate, not measured losses or demonstrated Senyap impact.

The workflow gaps are documented. The decision costs can compound.

Observed in program reports

What this may cost

Quality sourcing risk

Questbook concern in Plurality review
20 Dec 2023

Harder to identify strong teams
Review effort spent on weak fits

Fragmented communication

Funding delays and gaps in post-grant support
ARDC grant recommendations · 7 Mar 2025

Harder to plan execution
More time spent finding support

Reports establish workflow problems. The proposed consequences are inferences.

Senyap aims to surface context before commitment. Impact and willingness to pay remain unvalidated.

One market.
Two directions of discovery.

Side A

Find builders worth supporting

Ecosystem

Pays for builder signals

Opt-in builders

Side B

Find ecosystems worth joining

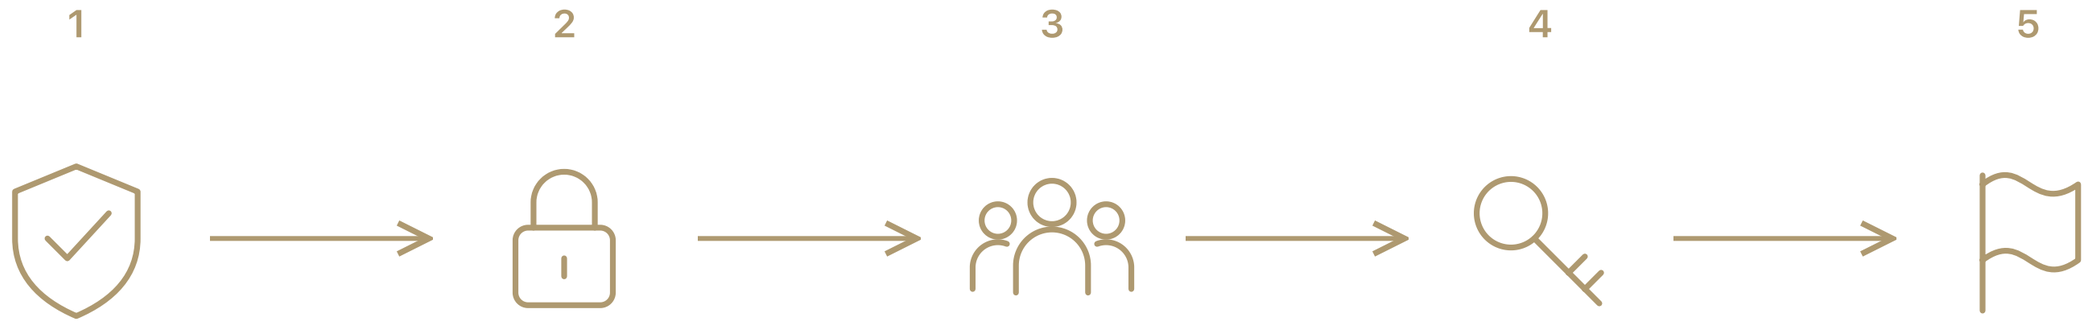

Builder

Pays for ecosystem signals

Ecosystems

Side A · two-slot exclusivity auction, then flat access. Side B · flat access with bounded A subsidy.

From private conviction to a paid signal.

Eight options maximum · Three positions per scout

Staking provides an incentive. It does not guarantee that a signal is true.

Which builder should we investigate first?

Before

Team A Team B Team C

C

Stake-backed support
+ first-hand reasons

Next decision

Interview Team B first

Test the execution evidence

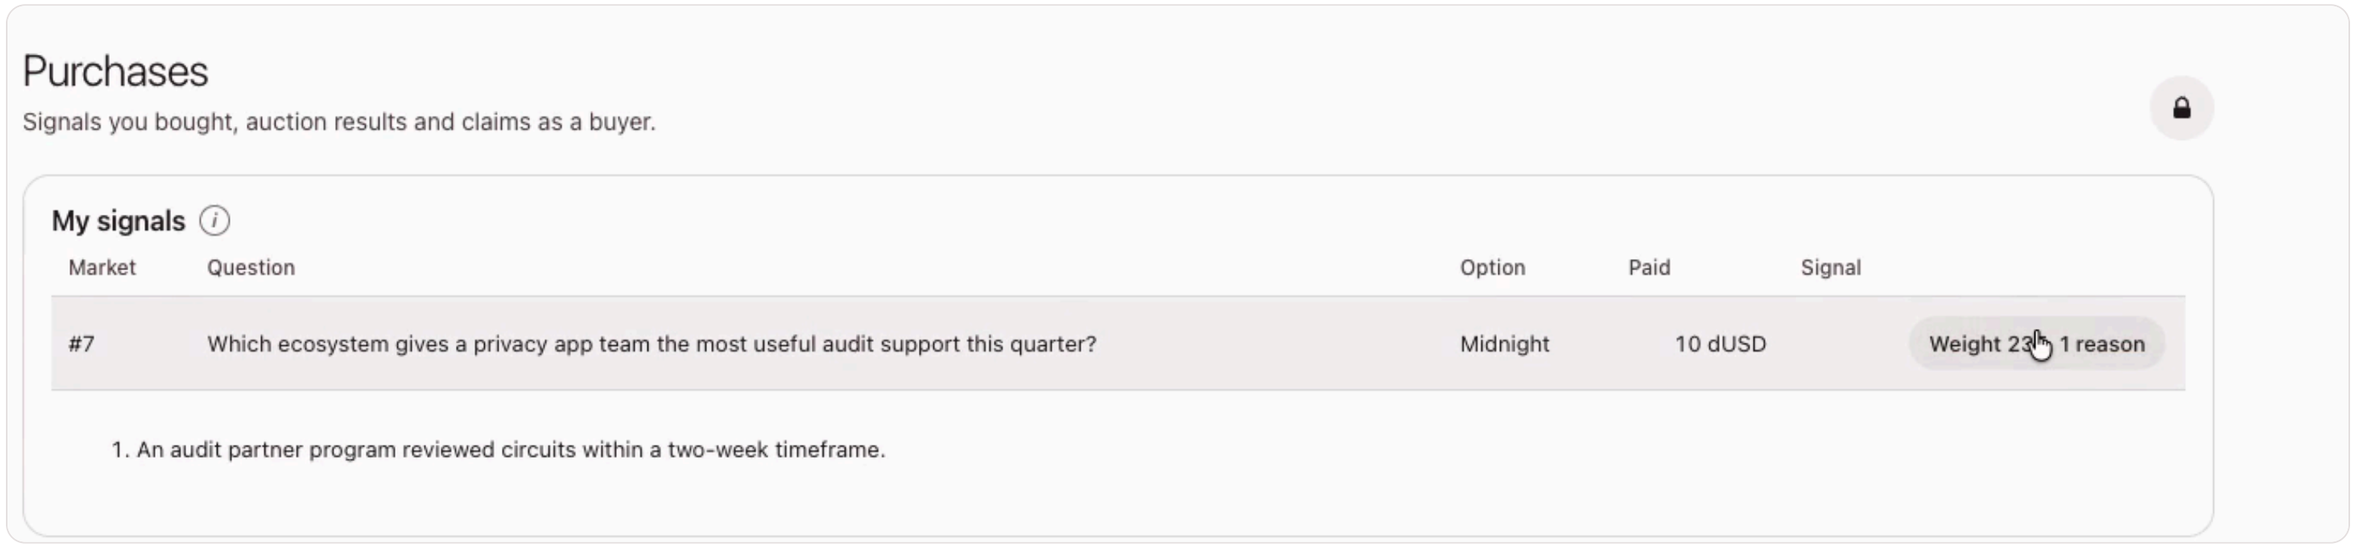

The signal guides due diligence. The ecosystem still makes the funding decision.

Illustrative Side A decision · synthetic support · no actual customer decision or pilot claimed.

The buyer opens a real product result.

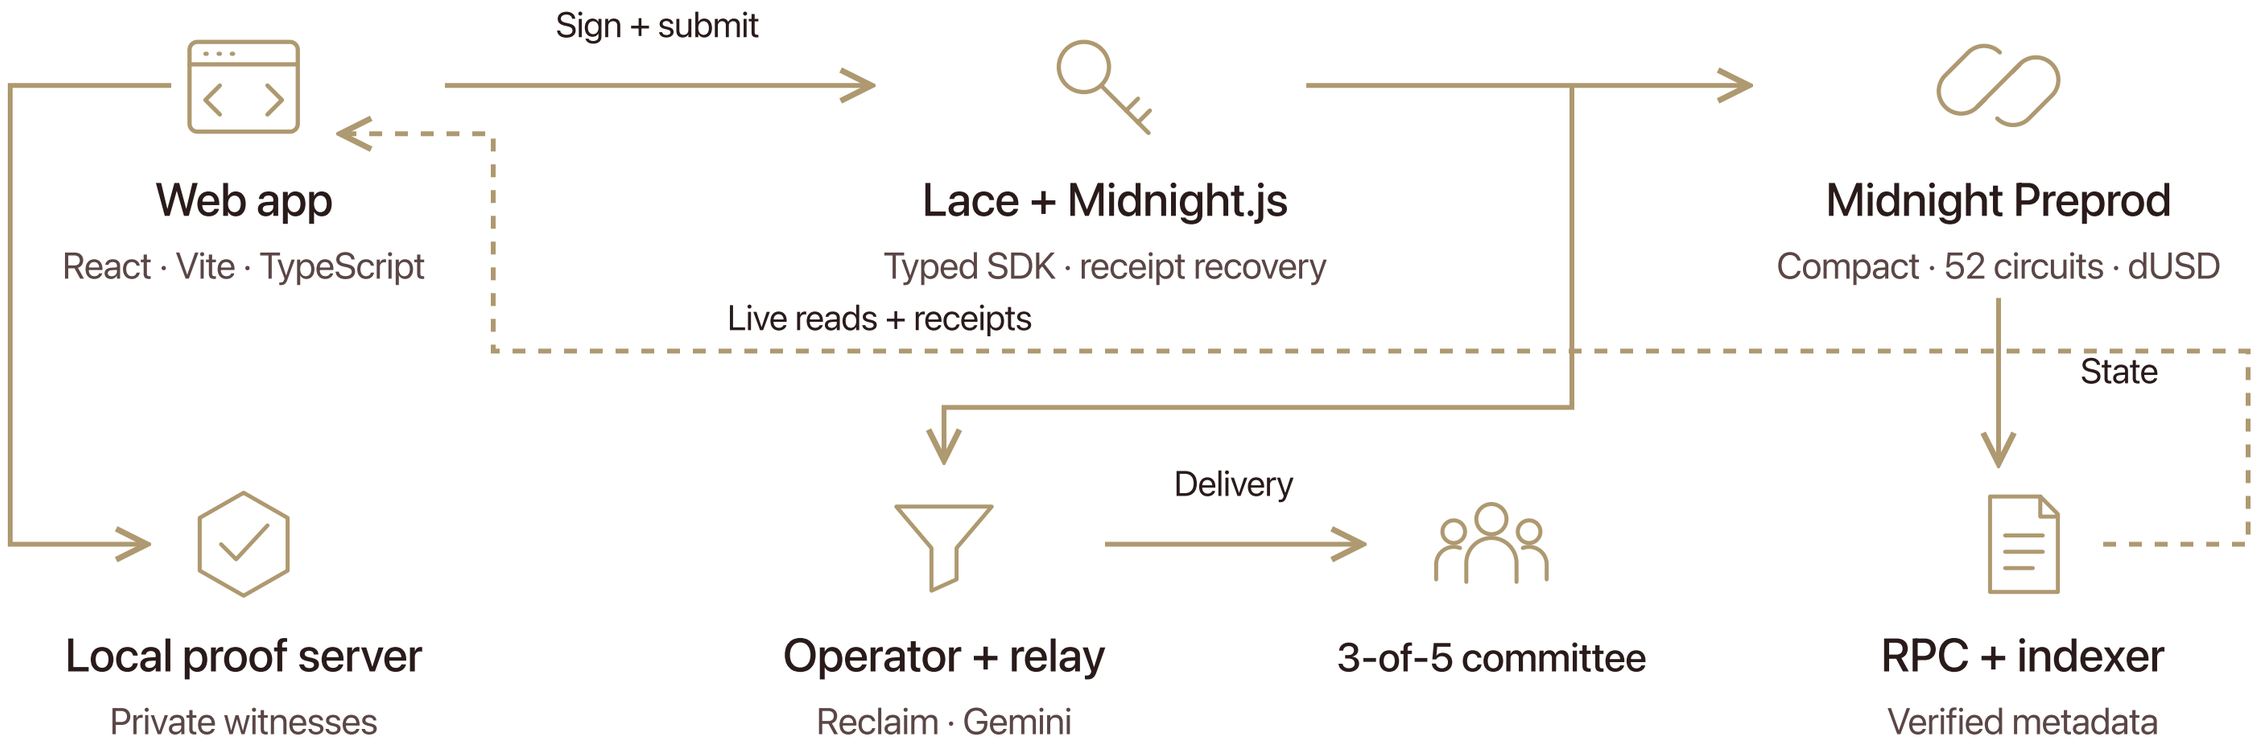

10 demo dUSD

Weight 235
One opened reason

Market #7 · owner browser purchase · synthetic content. Full settled lifecycle uses market #3.

Every component has an explicit job.

Local services handle sensitive data. Heavy proving is not entirely in the browser.

Why Midnight?
Prove the rules. Keep the pick private.

Private witness

Membership secret
Chosen option

Compact + ZK proof

Eligible member
Valid stake and state update

Public ledger

Accept valid transition
Reject invalid transition

Why Midnight

Verify market rules without publishing the scout's private pick or membership secret.

Privacy is selective · demo funding wallets and amounts remain public. Operator and prover trust still apply.

Private inputs.
Verifiable state changes.

Joint Shamir key generation + Feldman-style commitments

Reclaim proves logged-in access, not contribution count or full Sybil resistance.

Wrong-share slashing is not enforced. Three colluding shares can decrypt.

Deployed.
Executed and traceable.

52
Contract circuits

157
Finalized actions

7
Side B markets

Market #3 · completed Side B lifecycle

19 Oct snapshot · actions are not users. Owner-controlled seats and synthetic scout identities.

QA exercises the ways this product can fail.

Failure injected	Expected behavior	Evidence
Replay or malformed share	Reject the invalid input	Tested
Missing or late receipt	Keep uncertainty explicit	Tested
Expired or wrong-role action	Block the action safely	Tested

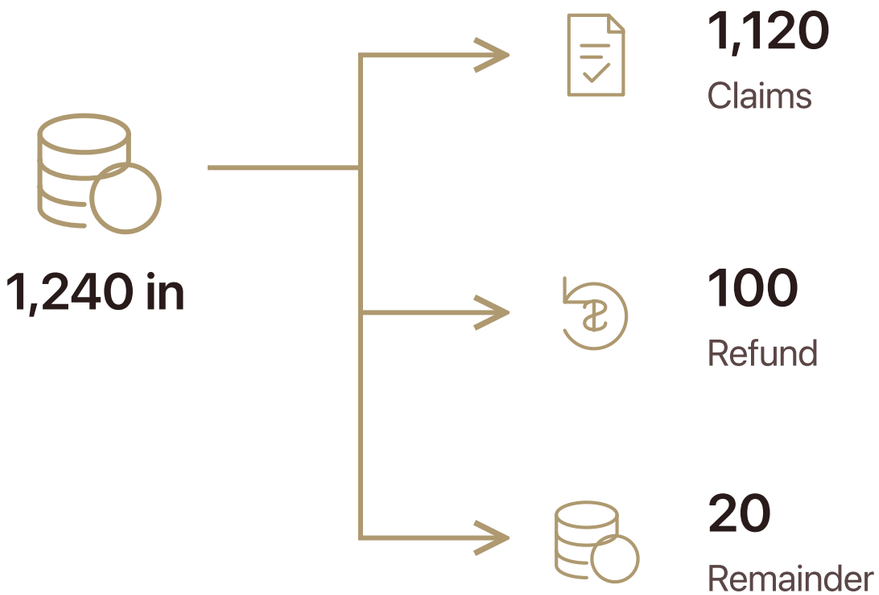

44 focused tests / 11 files passed · Full CI / 66 test files passed

Simulator, HTTP and frontend tests · integration journals · no independent security audit.

Follow the money.
Keep test versions visible.

Historical full cycle · r10

42 circuits · source 4f1b3390 · 84 actions

Current cancellation cycle · short-s2

52 circuits · source edb4251f · 67 transactions

- Public intent + opt-out
- Leaked-share seizure · 1,750 retained

Historical run settled both sides. Current short run demonstrates cancellation and enforcement.

Privacy has boundaries. Show who can see what.

Funding wallets

Wallet + amounts
Public on the ledger

Reason operator

Operator + Gemini
See reason text

Committee

Three shares
Can decrypt

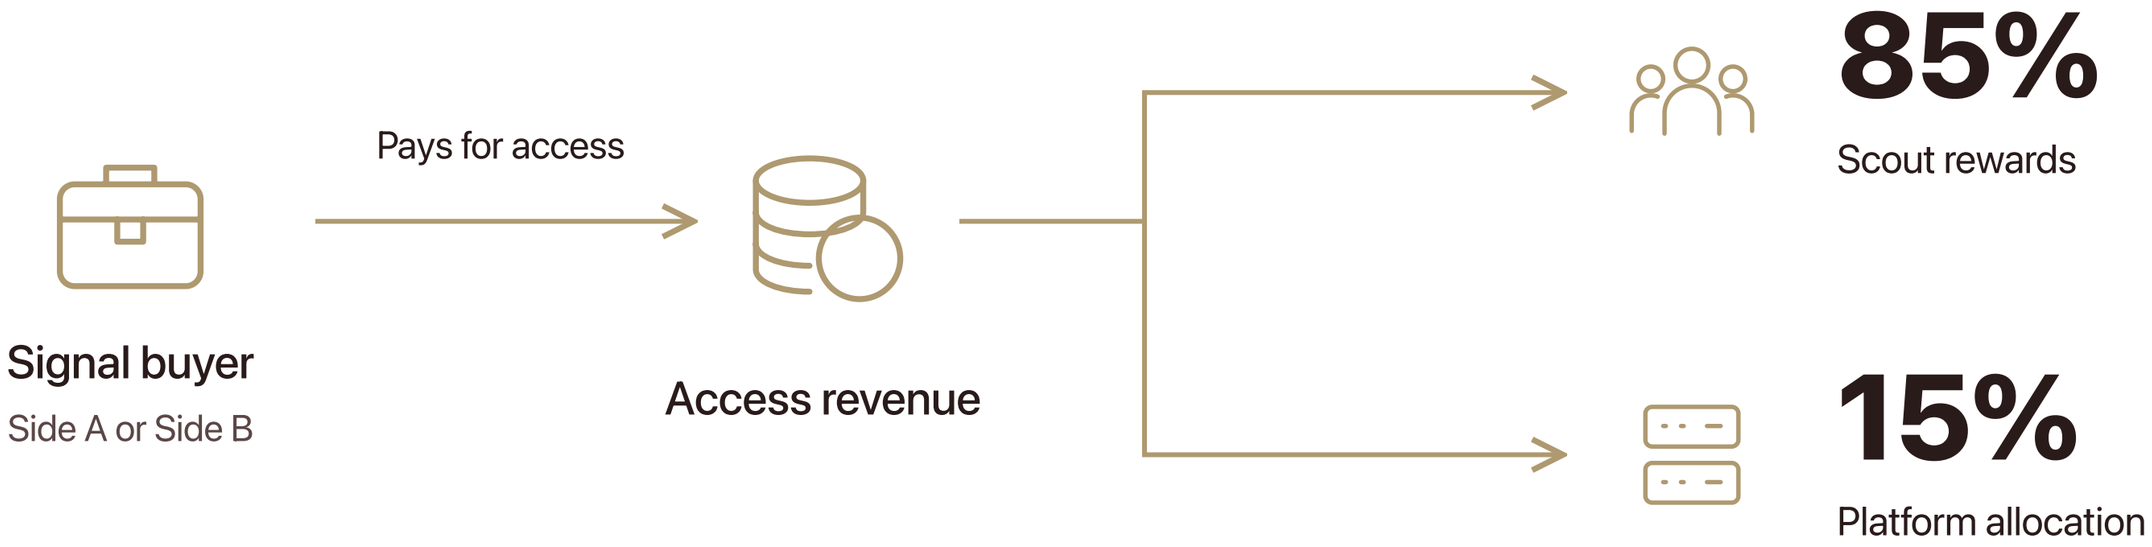

One owner controls the demo services

Independent operation is still to come

Local prover sees heavy-circuit witnesses. No network anonymity claim or independent audit.

Buyers fund access. Scouts share the upside.

Side A can support Side B with up to five percentage points of revenue.

Pricing and allocation are hypotheses. Demo dUSD is a test token. No paying customers claimed.

Next, make the signal useful in an opt-in pilot.

Validate the need

Builder + ecosystem interviews
Which decision changes?

Separate the operators

Committee independence
Review reason privacy

Run an opt-in pilot

Signal usefulness + purchase intent
Repeat use

Prior work, disclosed

Bisik · Solana / Colosseum

Idea + market mechanism

Carried forward

Senyap · Midnight / Wave 2

New Midnight implementation

No pilot claimed. Solana, Arcium and Semaphore code is absent from this repository.

A signal worth opening.
A source worth protecting.
